Hiring Team, FinPay

Dear Hiring Team,

I'm applying for the Backend Engineering Internship for summer 2027. Last summer I worked on the backend of a bookkeeping app for small shops, and the payments code was the part I cared about most. When it goes wrong, a shop owner can't trust their numbers at the end of the day. FinPay builds payments for the same kind of business, and I'd like to spend next summer working on that problem.

At Kirana Ledger, I wrote tests for the payments module and raised coverage from 35% to 70%. I also tracked down a slow PostgreSQL query on the transactions page and added an index, which brought load time from about 3 seconds to under 1. Your posting asks for someone who writes tests without being asked and digs into slow queries. That's the kind of work I enjoy.

I also like building things close to the people who use them. Shop owners used to ask support for their monthly sales reports on WhatsApp, so I built an API to export them as CSV and PDF. Requests to support dropped from about 40 a week to under 10. Outside the internship, I built the backend for a campus lost-and-found app that about 600 students installed in its first month.

I'd love to talk about how I could help on FinPay's payments and settlements services. Thank you for reading.

Best regards,
Riya Sharma
